

NEXUS Partner Mapping Portal

Functional Workflows & Client Questions

This document summarizes how the portal is intended to work, shows visual flows in text/diagram form, and lists the key questions we need answered to make all pages fully dynamic and production-ready.

1. HubSpot SSO, JWT & Login Workflow

The portal is embedded inside a HubSpot page as an iframe. HubSpot is responsible for resolving the current company/contact, calling a secure JWT mint backend, and appending the resulting token to the iframe URL as a `?jwt=<token>` parameter. The app decodes this token, creates a user session, and then routes the user to the appropriate portal pages based on their role and declarant type.

SSO + JWT Flow (to confirm with client)

```
flowchart LR
  A[User opens HubSpot page] --> B[HubSpot resolves company/contact]
  B --> C[HubSpot calls JWT mint backend\nHUBSPOT_MINT_URL]
  C --> D[Backend verifies company & signs JWT]
  D --> E[HubSpot builds iframe URL\n?jwt=]
  E --> F[Streamlit app loads]
  F --> G[App reads jwt from URL]
  G --> H[Decode claims & build session]
  H --> I{is_active?}
  I -->|Yes| J[Show portal pages]
  I -->|No| K[Access denied screen]
```

Questions for client (SSO & JWT):

- Who will own and operate the JWT mint backend endpoint (HUBSPOT_MINT_URL)?
- How should the mint endpoint verify that calls really come from HubSpot (signed requests, API key, IP allowlist, mTLS, etc.)?
- What is the desired session duration (token expiry) for portal users, and do different roles require different lifetimes?
- Which additional JWT claims (beyond partner key, type, role, is_active, default_currency, exp) are required by your security or reporting teams?
- How is the is_active flag derived in your systems, and who is responsible for activating/deactivating partner accounts?
- Do you require single signout between HubSpot and this portal iframe? If yes, what user experience do you expect?

2. Roles, Personas & Navigation

From the current implementation, we see three main personas: **Partner** (supplier or member), **Reviewer** (internal mapping reviewer), and **Admin** (configuration and calibration). Each persona unlocks a different set of pages and actions in the sidebar.

Role-based navigation (to confirm)

```
flowchart LR
A[JWT claims: type, role] --> B[Build UserSession]
B --> C{Role type}
C -->|partner| D[Partner portal pages\n+ Partner Mapping pages]
C -->|reviewer| E[Review queue & tools]
C -->|admin| F[Admin tools + reviewer scope]
```

Questions for client (roles & navigation):

- Are the three personas (partner, reviewer, admin) sufficient, or do you foresee additional roles or sub-roles?
- For each page (Dashboard, Member Directory, My Company, Mapping, Upload, History, Logs, News, Help, Admin), which roles should have full access, read-only access, or no access?
- After login, which landing page should each persona see by default (e.g. Dashboard for partners, Review Queue for reviewers)?

3. Hub Portal Dashboard & Data Sources

The Hub Dashboard composes hero banner, overview KPIs, ranking tables, and sales charts. Data is loaded from Snowflake (or demo fixtures) using the partner's effective Snowflake role derived from the JWT. The intent is to show each partner a focused view of their performance and position in the network.

Questions for client (dashboard & data):

- Which KPIs must appear on the main dashboard (e.g. total turnover, YOY growth, volume, forecast, margin)?
- For each KPI, what is the precise definition (numerator, denominator, filters, time window)?
- At what grain is data stored and visualized (daily, weekly, monthly)?
- How often should dashboard data be refreshed (near real-time, hourly, daily)?
- Should partners see only their own data, or also anonymized peer benchmarks? If benchmarks are needed, what aggregation rules apply?
- Is Snowflake the single source of truth, or do some KPIs need to come from other systems (HubSpot, CRM, ERP)?

4. Member Directory & Identify Partners

The Member Directory combines a rich filter bar, a list of companies and decision-makers, and a map. Currently it is wired to demo data; the goal is to turn it into a dynamic search experience that surfaces real members and suppliers based on geography, segment, and product fit.

Member Directory search flow

```
flowchart LR
A[User opens Member Directory] --> B[Set search & filter criteria]
B --> C[Query directory data store\n(own DB / Snowflake / HubSpot)]
C --> D[List of companies & contacts]
C --> E[Map of locations]
```

Questions for client (member directory):

- Where should the authoritative list of member companies and contacts come from (HubSpot CRM, another CRM, Snowflake tables, or a dedicated partner master DB)?
- Which search and filter dimensions are mandatory (region, country, segment, size, brands, product ranges, languages, etc.)?
- Which contact details may be shown in the directory (email, phone, LinkedIn) and what GDPR/consent rules apply?
- If we cache CRM data in our own DB for performance, how often should it be synchronized and which system remains the master for edits?

5. News & Insights (Blog / News)

The News & Insights page already mirrors the final visual design: rich hero article, three-column article grid, filters, and a sidebar highlighting new entrants. Today it reads from local fixtures; the intent is to back it with a proper content store or CMS and integrate the 'Request publication' dialog into your editorial workflow.

Questions for client (news & content):

- Which system should act as the primary CMS for news and articles (HubSpot blog, another CMS, or an internal content DB)?
- Who can submit content (internal editors only, or also selected suppliers/members) and what approval steps are required before publishing?
- Should clicking 'Read' open an internal article detail page inside the portal, or redirect to an external URL (e.g. HubSpot blog)?
- Should the 'New entrants' sidebar reflect real onboarding events from your systems, and if so, which fields define a 'new entrant' and over what time window?
- Do you need analytics on article consumption (views, clicks, conversions), and where should those metrics be stored?

6. My Company, Contacts & Documents

The My Company page displays company overview information, key contacts, news, documents, and media. In production it should be backed by your master data for each partner and allow controlled self-service updates where appropriate.

Questions for client (My Company):

- Where is the system of record for company profile data (name, brands, segments, websites) and for individual contacts?
- Can portal users add, edit, or delete contacts and company details directly, or must all changes flow through an internal process?
- Which document and media types must be supported (offers, contracts, marketing assets, training), and where should they be stored (DMS, cloud object storage, Snowflake external stages)?
- Do you require document versioning, expiry dates, or approval flows before new documents become visible to partners?

- Within each partner company, do you foresee different permissions (e.g. company admins vs standard users) for editing vs viewing content?

7. Partner Mapping: Declarations, Upload & Review

The Partner Mapping workflow lets partners upload declaration files, then routes them through an internal review process where mappings are validated and stored for future reuse. The goal is to progressively automate mapping based on past decisions while keeping a clear audit trail.

Declaration upload & review flow

```

flowchart LR
  A[Partner uploads declaration file] --> B[Upload service parses file]
  B --> C[Create mapping proposals]
  C --> D[Store proposals\n(Snowflake / app DB)]
  D --> E[Review Queue shows pending items]
  E --> F[Reviewer validates / rejects]
  F --> G[Write approved mappings to memory store]
  G --> H[Future uploads reuse learned mappings]

```

Questions for client (mapping workflow):

- Which file formats and layouts do partners use for declarations (Excel, CSV; standardized columns vs per-partner templates)?
- What validation rules must run at upload time (required columns, date windows, currency checks, duplication checks)?
- Who are the reviewers (internal only, or also partner power users) and do you need multiple review stages (e.g. junior review + senior approval)?
- When a mapping is validated, should it become a permanent rule for that partner, for all partners, or be time-bound?
- What audit information must we capture for each mapping decision (who changed what, from which value to which value, at what time, with what reason)?

8. Data Storage Strategy & Compliance

The platform will combine Snowflake for analytical data with an application database and external systems like HubSpot and your CRM. We need to fix clear boundaries of responsibility and retention for each data category.

Questions for client (data & compliance):

- For each entity (partners, contacts, declarations, mappings, news, logs, notifications), which system is the system of record (Snowflake, CRM, app DB, CMS)?
- Which entities must be stored in our own database for performance or history, and how long should we retain them?
- What right-to-be forgotten or anonymization rules apply, especially for personal data such as contacts and login history?
- Are we allowed to write changes back to HubSpot/CRM, or are those systems strictly read-only from the portal's perspective?
- Do we need strict multitenancy or regional isolation (e.g. per region, per business unit) at the data level?

9. Logs, Notifications & Activity Feeds

The Logs and workflow log widgets will surface important events to partners and internal users. We need to agree which events are exposed where, and which channels are used for notifications.

Questions for client (logs & notifications):

- Which events should be visible to partners in the Logs page (uploads, approvals, rejections, profile changes, login history)?
- Do you need a separate internal log for admins and support with more technical detail (error codes, stack traces, SQL details)?
- For which events should users receive notifications (email, in-app, both) and what are the preferred channels and templates?

10. Final Consolidated Questions

To finalize the design of the platform, please provide your decisions on the following points. These answers will be turned into a detailed specification for development and configuration:

- Systems of record for each data type (partners, contacts, declarations, mappings, news, logs, notifications).
- Role and permission matrix per page and feature for partners, reviewers, and admins.
- Data retention, anonymization, and audit requirements across all entities.
- Integration boundaries and allowed write-backs to HubSpot, CRM, and other systems.
- Any additional workflows or screens you expect that are not yet captured in this document.
